Python Arithmetic Operators – Practice Questions

1. Write a program to add two numbers entered by the user.
2. Write a program to find the difference between two numbers.
3. Write a program to multiply three numbers.
4. Write a program to divide one number by another.
5. Write a program to calculate the square of a number.
6. Write a program to calculate the cube of a number.
7. Write a program to calculate the average of three numbers.
8. Write a program to calculate the total price of 5 notebooks if the price of one notebook is entered by the user.

9. Write a program to find the quotient and remainder when one integer is divided by another.

10. A shop has 47 chocolates. If each box holds 6 chocolates, calculate:

- The number of completely filled boxes.
- The number of chocolates left over.

11. Write a program to convert a given number of minutes into complete hours and remaining minutes.

12. Write a program to convert 367 seconds into minutes and remaining seconds.

13. A teacher wants to distribute 53 students into groups of 8. Calculate the number of complete groups and the students left over.

14. Write a program to extract the last digit of a positive integer using the modulus operator.

15. Write a program to remove the last digit of a positive integer using floor division.

16. Shopping bill: A customer buys 3 pens costing ₹15 each and 2 notebooks costing ₹40 each. Calculate the total bill.

17. Salary calculation: An employee earns ₹800 per day. Calculate their salary for 26 working days.

18. Distance conversion: Convert a distance given in kilometers into meters and centimeters.

19. Rectangle: Accept the length and width of a rectangle and calculate its area and perimeter.

20. Simple interest: Accept the principal amount, annual interest rate, and time in years. Calculate the simple interest using:

$$SI=(P\times R\times T)\ /100$$

21. Bill sharing: Accept a restaurant bill and the number of friends. Calculate how much each friend should pay if the bill is shared equally.

22. Travel calculation: A car travels 180 km using 12 liters of fuel. Calculate its mileage in km per liter.

23. Unit price: Accept the total price of a packet of rice and its weight in kilograms. Calculate the price per kilogram.

24. Time conversion: Accept a total number of hours and convert it into complete days and remaining hours.

25. Power calculation: Accept a number and an exponent, then calculate the result using the `**` operator.
